## 0.1 Problem 1

Let a, b be real numbers. Let's assume that, for all real numbers x, y the inequality  $|(ax + by)(ay + bx)| \le x^2 + y^2$  is satisfied. Show that  $a^2 + b^2 \le 2$ .

```
theorem problem1: fixes a b :: real assumes given: \bigwedge x y :: real. |(a*x + b*y)*(a*y + b*x)| \le x^2 + y^2 shows a^2 + b^2 \le 2 proof — from given [where x=1 and y=1] have (a+b)^2 \le 2 by (simp\ add:\ power2\text{-}eq\text{-}square) moreover from given [where x=1 and y=-1] have (a-b)^2 \le 2 by (simp\ add:\ power2\text{-}eq\text{-}square\ right\text{-}diff\text{-}distrib') ultimately have (a+b)^2 + (a-b)^2 \le 4 by auto moreover have (a+b)^2 + (a-b)^2 = 2*(a^2 + b^2) by algebra ultimately show a^2 + b^2 \le 2 by auto qed
